

I explored the offer on Canva and found the template that could match my topic. I added my future skills, career objectives, and other relevant details to my resume. Besides, I used the tool to find out other needed information and to improve the grammar. Concerning the resume format, I used the previous version of the resume as a basis for comparison, which helped me to create an updated version for the job application. For the other part of the project, I searched the web for Canva templates similar to mine and chose the one that matched my topic. I used AI occasionally but managed to fulfill most of the tasks on my own. Besides, I always double-checked the information to ensure its accuracy and reliability instead of asking for AI assistance. I used Google and sometimes the tool itself to verify and validate the information. As for the tools used for this project, AI was primarily used as an editorial tool and secondarily as a research instrument, yet my input was always valued. I tried to make sure that my ideas and thoughts were the basis for creating the resume, while the tool helped me to formalize and organize the information. In addition, my privacy was respected since I cropped the documents before sending them if required, sharing sensitive information. I also limited the amount of personal information provided to the tool; thus, minimizing the risks. Overall, I made sure to use the tool appropriately and took responsibility for my actions.
